

Support Health Analysis: Meridian Health (MERID-001)

Support Health Analysis - Meridian Health (MERID-001)

This report analyzes support ticket history for Meridian Health over the analysis period. The organization has submitted 14 tickets across multiple departments, with a focus on technical onboarding, configuration, and incident resolution.

Executive Summary

Metric	Value
Total Tickets Analyzed	14
Resolved Tickets	8 (57%)
Open/Pending Tickets	6 (43%)
Average Resolution Time	22.1 hours
Median Resolution Time	21.0 hours
Fastest Resolution	2.5 hours (TKT-4876)
Slowest Resolution	47.6 hours (TKT-4871)
Critical Priority Tickets	1 (platform outage)
High Priority Tickets	3 (bugs requiring attention)

Ticket Distribution by Category

Category	Count	Examples
How-To / Knowledge	3	Dashboard setup, anomaly detection, audit logs
Bug / Technical Issue	3	Webhook delivery, trace propagation, API timeouts
Configuration	2	Alert tuning, rate limits
Billing	2	Seat utilization, invoice line items
Onboarding	1	Kubernetes microservices setup
Incident	1	Platform outage (P1)
Performance	1	Dashboard loading speed

Ticket Priority Distribution

Priority Level	Count	Status
Critical	1	1 platform outage (resolved in 3.7 hours)

Priority Level	Count	Status
High	3	2 bugs pending, 1 resolved quickly
Medium	6	Mostly configuration and billing issues
Low	3	Training/how-to requests

Support by Department

Department	Ticket Count	Primary Issues
Engineering	8	Onboarding, bugs, performance, compliance
Marketing	3	Dashboard configuration, alerting
Procurement	1	Billing and compliance
General	1	Platform incident
All	1	Platform incident (database migration failure)

Detailed Ticket Table

Ticket ID	Priority	Category	Status	Resolution Time	Satisfaction
TKT-4850	medium	onboarding	open	26.1h	-
TKT-4852	medium	configuration	open	8.6h	-
TKT-4858	low	how_to	open	21.9h	-
TKT-4867	high	bug	open	Pending	-
TKT-4871	low	billing	open	47.6h	-
TKT-4876	medium	configuration	open	2.5h	-
TKT-4880	medium	performance	open	Pending	-
TKT-4883	medium	how_to	open	Pending	-
TKT-4885	low	how_to	open	46.5h	-
TKT-4887	medium	general		Pending	-
TKT-4889	high	bug	open	20.2h	-
TKT-4891	high	bug	open	Pending	-
TKT-4893	critical	incident	open	3.7h	-
TKT-4895	medium	billing	open	Pending	-

Key Findings and Observations

1. **STRONG INCIDENT RESPONSE:** The critical platform outage (TKT-4893) on 2025-01-14 was resolved in 3.7 hours with excellent communication to the customer. A database migration failure was quickly identified and rolled back, with data backfilled automatically.

2. **TECHNICAL EXPERTISE:** The support team (Alex Torres, Priya Sharma, Kevin Liu) demonstrates strong technical depth. They successfully resolved complex issues including Kubernetes integration, gRPC trace propagation, and webhook delivery problems.
3. **RECURRING CUSTOMER - STRONG RELATIONSHIP:** David Wu from Engineering has been the primary contact for 8 tickets. The support team has built rapport with him, providing proactive technical guidance and Enterprise tier trial access.
4. **ONBOARDING SUCCESS:** The initial onboarding ticket (TKT-4850) was resolved in 26.1 hours with positive customer feedback. The team's Kubernetes quickstart guide and custom sidecar adapter configuration enabled the customer to instrument all 40 microservices.
5. **SLOWER RESOLUTION ON BILLING/ADMINISTRATIVE ISSUES:** Billing-related tickets took longer (47.6 hours for TKT-4871), though these are lower priority and don't require immediate technical intervention.
6. **CUSTOMER SATISFACTION CONCERN:** While no formal satisfaction surveys have been completed yet, one ticket (TKT-4895) shows a note that the customer (Margaret Walsh, CFO) scrutinizes every invoice line item. An incorrect invoice line-item breakdown on contract renewal caused frustration, though the total amount was correct.
7. **PENDING CRITICAL ISSUE:** TKT-4891 (API 504 timeouts on v2/transactions endpoint) has been open since 2025-02-07 with partial workarounds but not full resolution. The customer (Maria Chen) is frustrated and requesting escalation to senior engineers. This is blocking their daily procurement operations.

Recurring Issues and Patterns

Issue Type	Occurrences	Impact
Kubernetes compatibility/configuration	2	K8s 1.29 probe timing, pod networking changes
Alert configuration and tuning	2	False positives, threshold optimization
Dashboard and monitoring UI	2	Performance, UI changes between releases
API/webhook integration	2	Connection pool issues, trace propagation
Marketing/campaign monitoring	3	Seat utilization, cost anomaly detection

Recommendations for Improvement

1. **ESCALATION PROTOCOL FOR KUBERNETES ISSUES:** Implement a dedicated escalation path for Kubernetes version compatibility issues. The current troubleshooting (probe timing, connection pool adjustments) is iterative and slow. Create a compatibility matrix that's updated with each K8s release, and have Priya Sharma or another senior engineer review K8s-related tickets within 2 hours.
2. **PROACTIVE RELEASE NOTES FOR UI CHANGES:** Customer feedback (TKT-4885) shows that UI reorganization between releases confuses users who don't log in frequently. Send targeted release notes to affected user segments, not just email blasts. Consider in-app notifications for significant UI changes.
3. **INVOICE ACCURACY REVIEW PROCESS:** For Enterprise tier customers and contract renewals, implement a pre-invoice review step where the billing team presents line items to the account

manager for validation before sending to the customer. This prevents frustration from Margaret Walsh (CFO) and Procurement teams.

4. CUSTOMER SATISFACTION SURVEY TIMING: Currently, satisfaction surveys are sent after ticket resolution, but not all customers are responding. Consider sending surveys within 24 hours of resolution while the experience is fresh, and allow optional feedback comments to capture nuance.

5. KUBERNETES 1.29 COMPATIBILITY HOTFIX: TKT-4891 (4% error rate on v2/transactions after K8s 1.29 upgrade) requires immediate senior engineer attention. The DNS TTL caching issue needs to be reproduced and fixed in the agent code, not just worked around in customer config. Target resolution within 24 hours.

6. KNOWLEDGE BASE EXPANSION: The team has solved multiple Kubernetes integration problems. Document these solutions (K8s 1.29 probe timing, sidecar patterns, connection pool sizing) in a public knowledge base to reduce future support volume for similar issues.

7. ESTABLISH SLA TARGETS: Define explicit SLAs by priority level. For example: Critical issues within 1 hour, High priority within 4 hours, Medium within 8 hours. Current average (22.1 hours) is good but inconsistent.

8. RENEWAL ENGAGEMENT: David Wu's team is considering Enterprise tier upgrade. Ensure Elena (account manager) is tracking the gRPC trace propagation fix (TKT-4889) and its impact on the renewal decision. This is a renewal driver.

Conclusion

Meridian Health represents a high-value, technically sophisticated customer with strong growth potential. The support team has done excellent work on incident response, technical onboarding, and customer relationship building. The main areas for improvement are (1) faster resolution of Kubernetes compatibility issues, (2) clearer communication about UI changes, (3) invoice accuracy for procurement teams, and (4) follow-up on one pending critical issue. With these improvements, the account is well-positioned for Enterprise tier adoption and long-term partnership.
